## RESEARCH INTEREST

---

My primary research area is high-performance computing, with a focus on designing scalable solutions for real-world combinatorial optimization problems. I am particularly interested in leveraging modern algorithmic tools—including streaming, randomized, parallel, distributed, and dynamic techniques—to tackle problems that arise in diverse domains such as quantum chemistry, data science, and machine learning. My work integrates strong theoretical foundations, such as provable approximation guarantees, with a deep emphasis on practical applicability, ensuring that the developed algorithms are both efficient and deployable in real-world settings.
